

Opportunities, challenges and limitations of Species Distribution Models (SDM):

Implications for decision-making in support of
biodiversity conservation and sustainable land use

"Biodiversity of Africa - Observation and Sustainable Management for our Future!"
International Congress, 29 September – 3 October 2008, at Spier, RSA

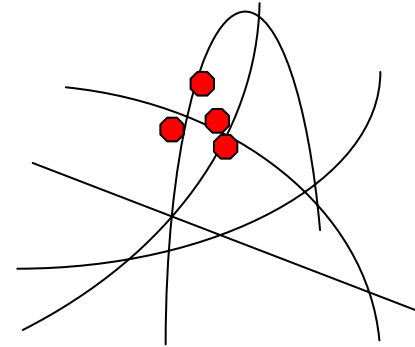

What is an SDM?

species localities

geographic space

n-dimensional ecological space

prediction into geographic space

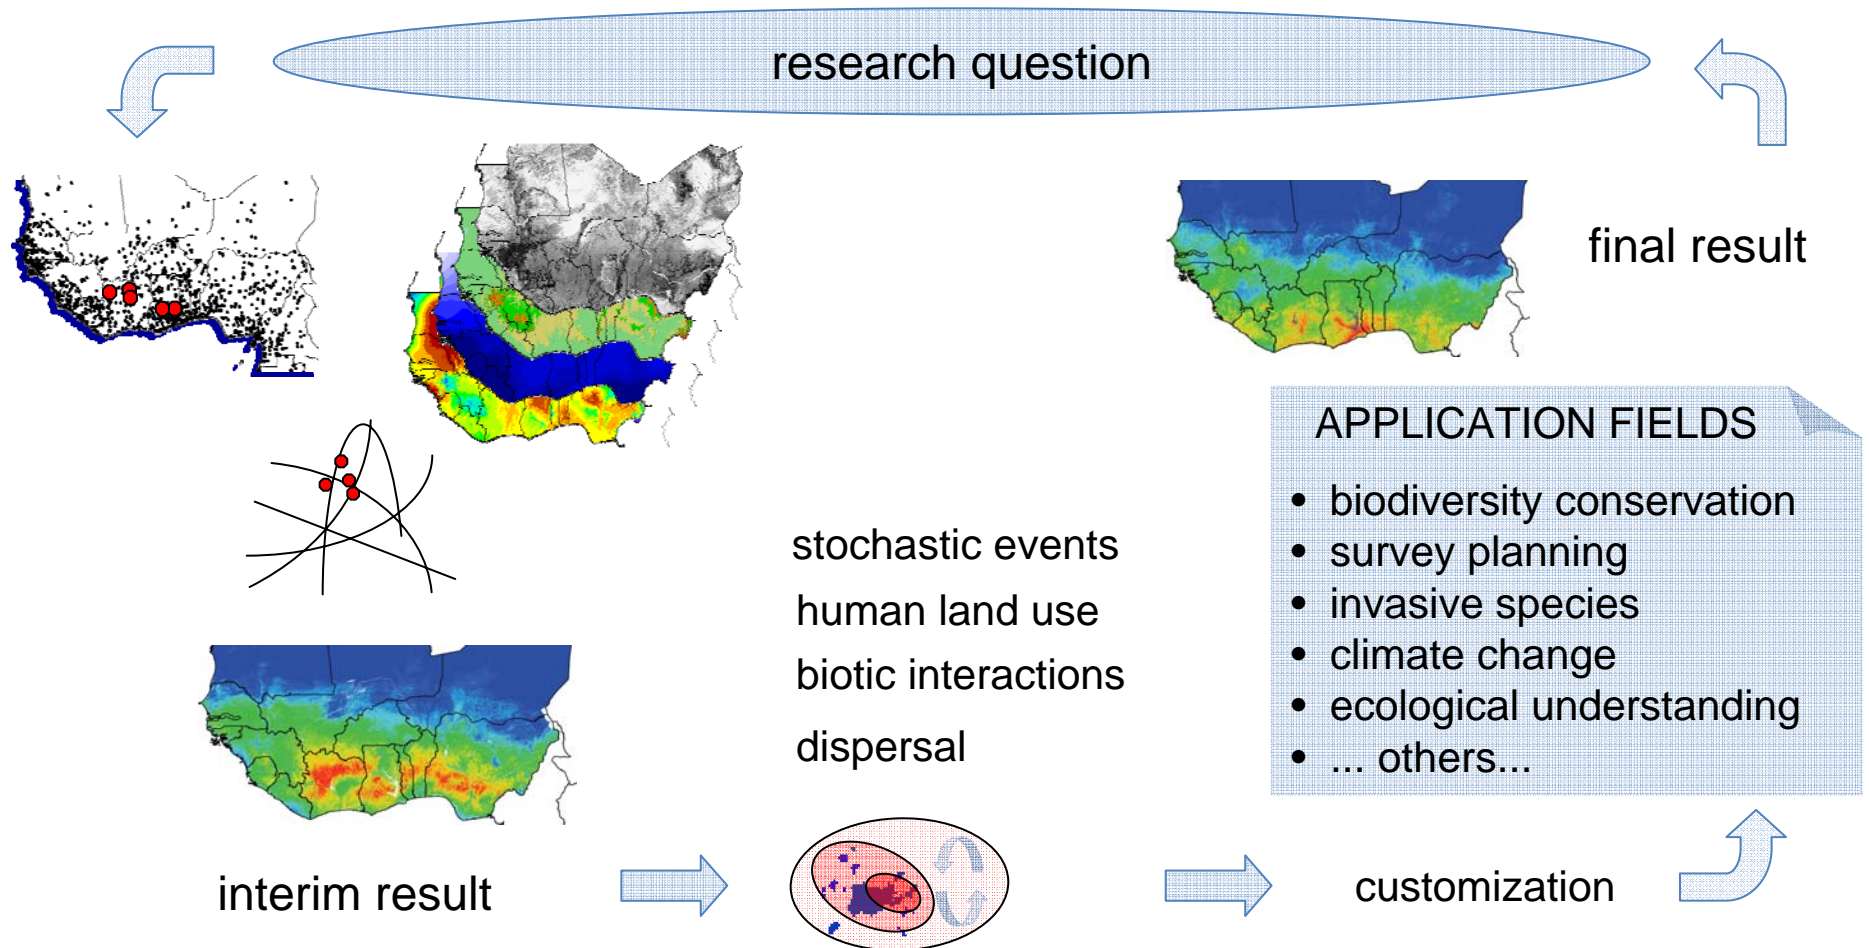

BIOLOG

Federal Ministry of Education and Research

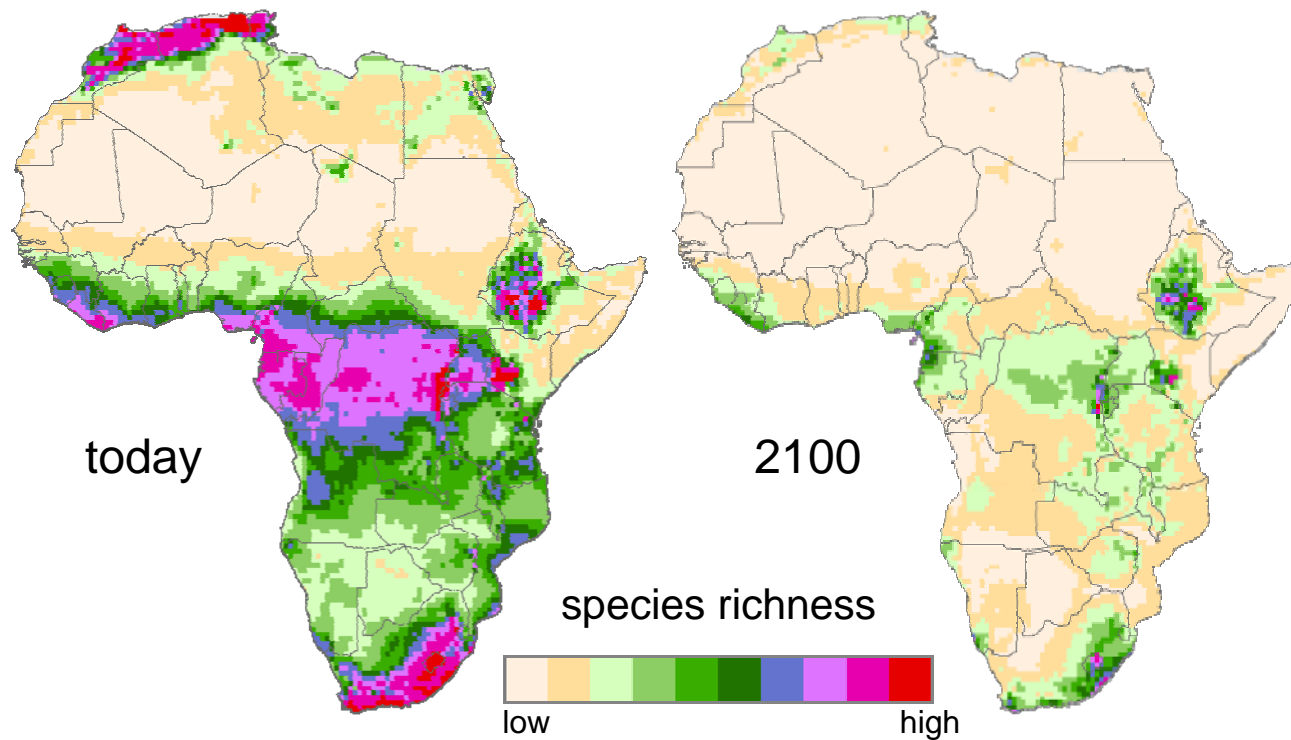

The complete workflow

What are SDM good for?

Example 1: prepare for climate change

[BIOTA West / Sommer et al.]

HadCM3 climate model, IPCC A1FI Scenario, +4°C

Selected challenges and solutions

Species occurrence data

all good?

Observations: an untapped resource for SDM?

[BIOTA West / Schmidt et al.]

• Availability

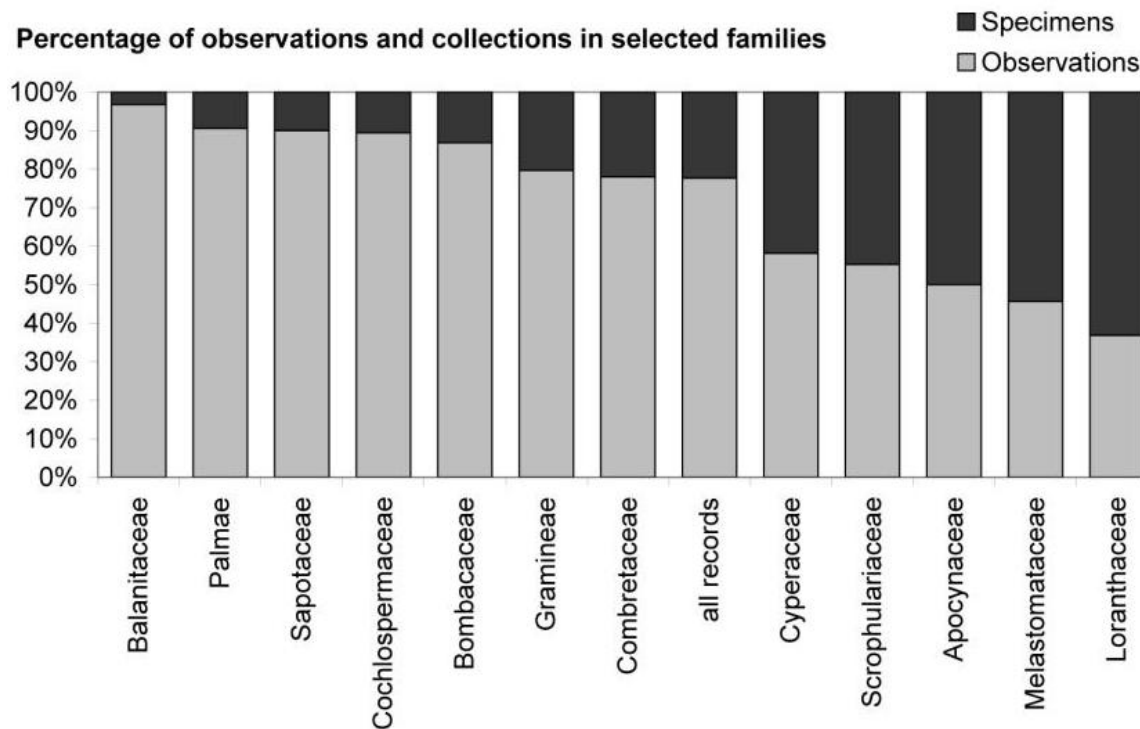

- Sample Size
- Sampling Bias
 - Spatial autocorrelation
- Accuracy
 - geographic
 - taxonomic

supports validation
(and possibly calibration)

Selected challenges and solutions

Environmental variables

spoilt for choice

Seeing the world through the eyes of a ...

- Availability

- finer spatial res.
- time series
- hyperspectral

- Selection

→ multicollinearity

- Transformation
- Consistency

BIOLOG

Federal Ministry
of Education
and Research

Environmental variables

spoilt for choice

Seeing the world through the eyes of a ...

e.g. CHRIS-Proba satellite data
32 / 64 channels
32 m / 17 m spat. res.
however: swath width only 14 km

extract spectral profiles
of surface features and indices,
e.g. NDVI

Inferring biodiversity from spectral heterogeneity
(spectral variation hypothesis) → direct use

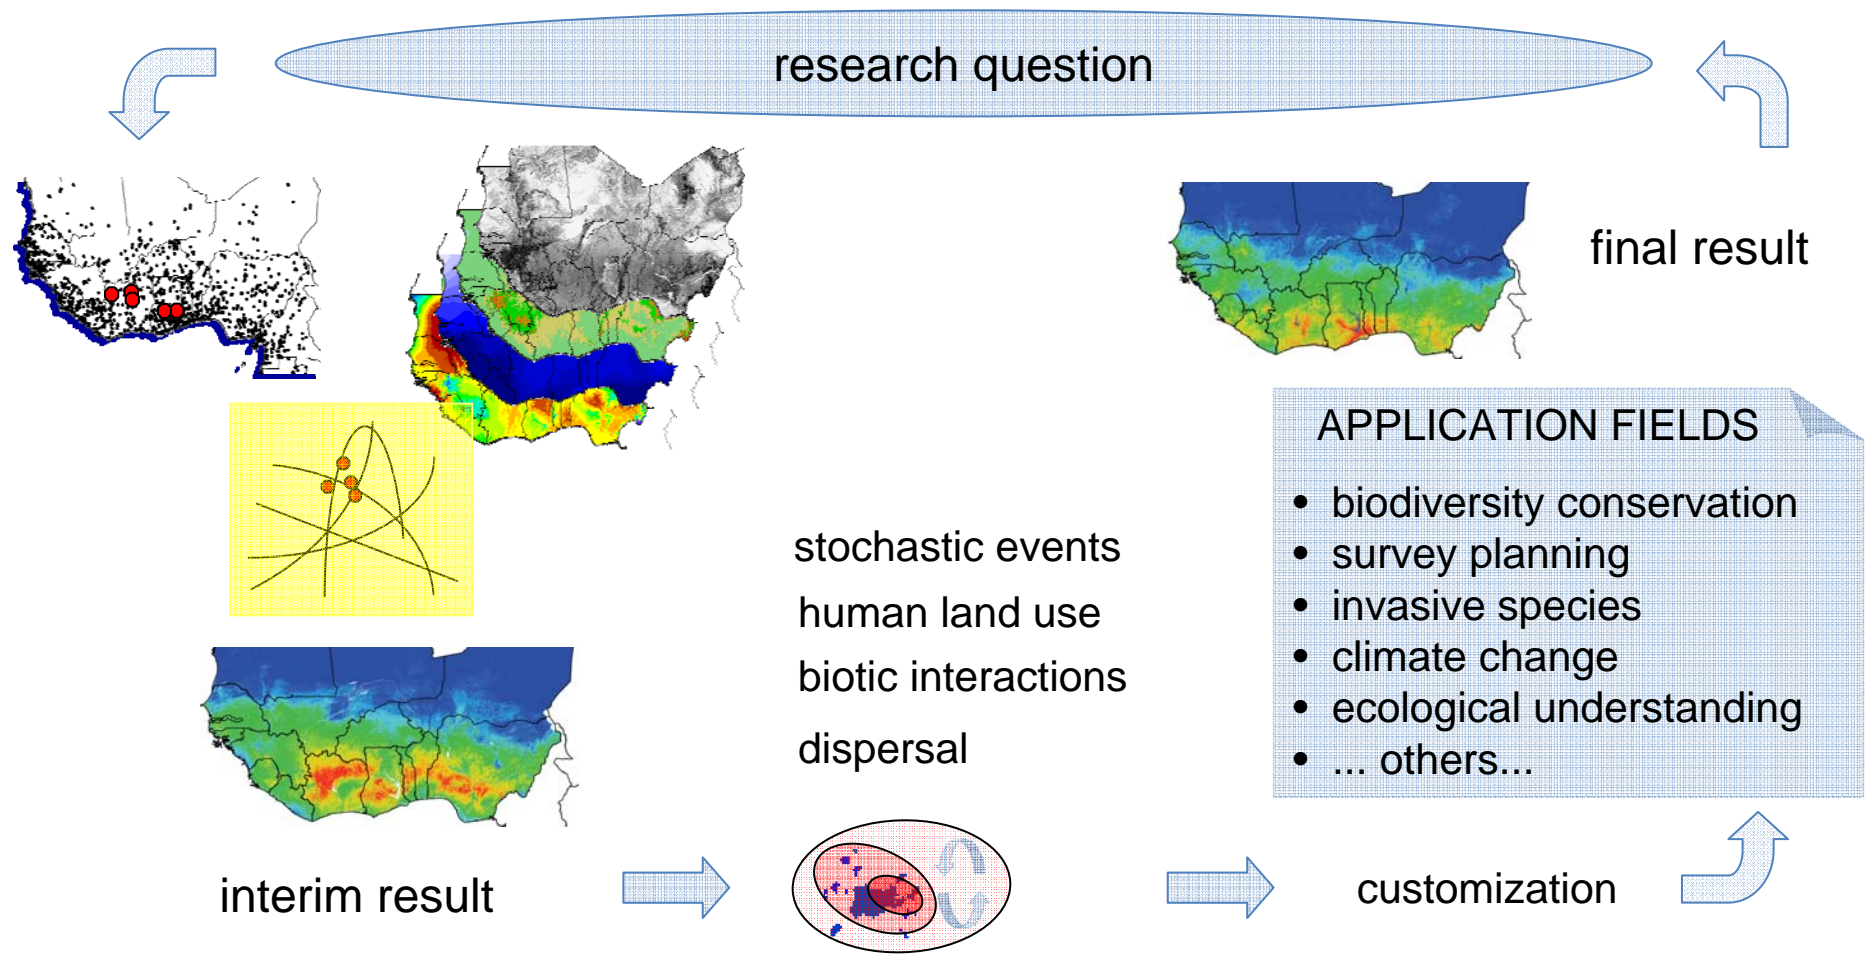

Inferring biodiversity from aggregated SDM: create
new environmental variables from hyperspectral data
→ indirect use

- Availability
 - finer spatial res.
 - time series
 - hyperspectral

- Selection
 - multicollinearity
- Transformation
- Consistency

[BIOTA Süd / Oldeland et al in prep.]

Selected challenges and solutions

The statistical model

magic or math?

predicted probability (GLM)

Kriging interpolation
of residuals

SDM prediction
(GLM) + interpolated
residuals

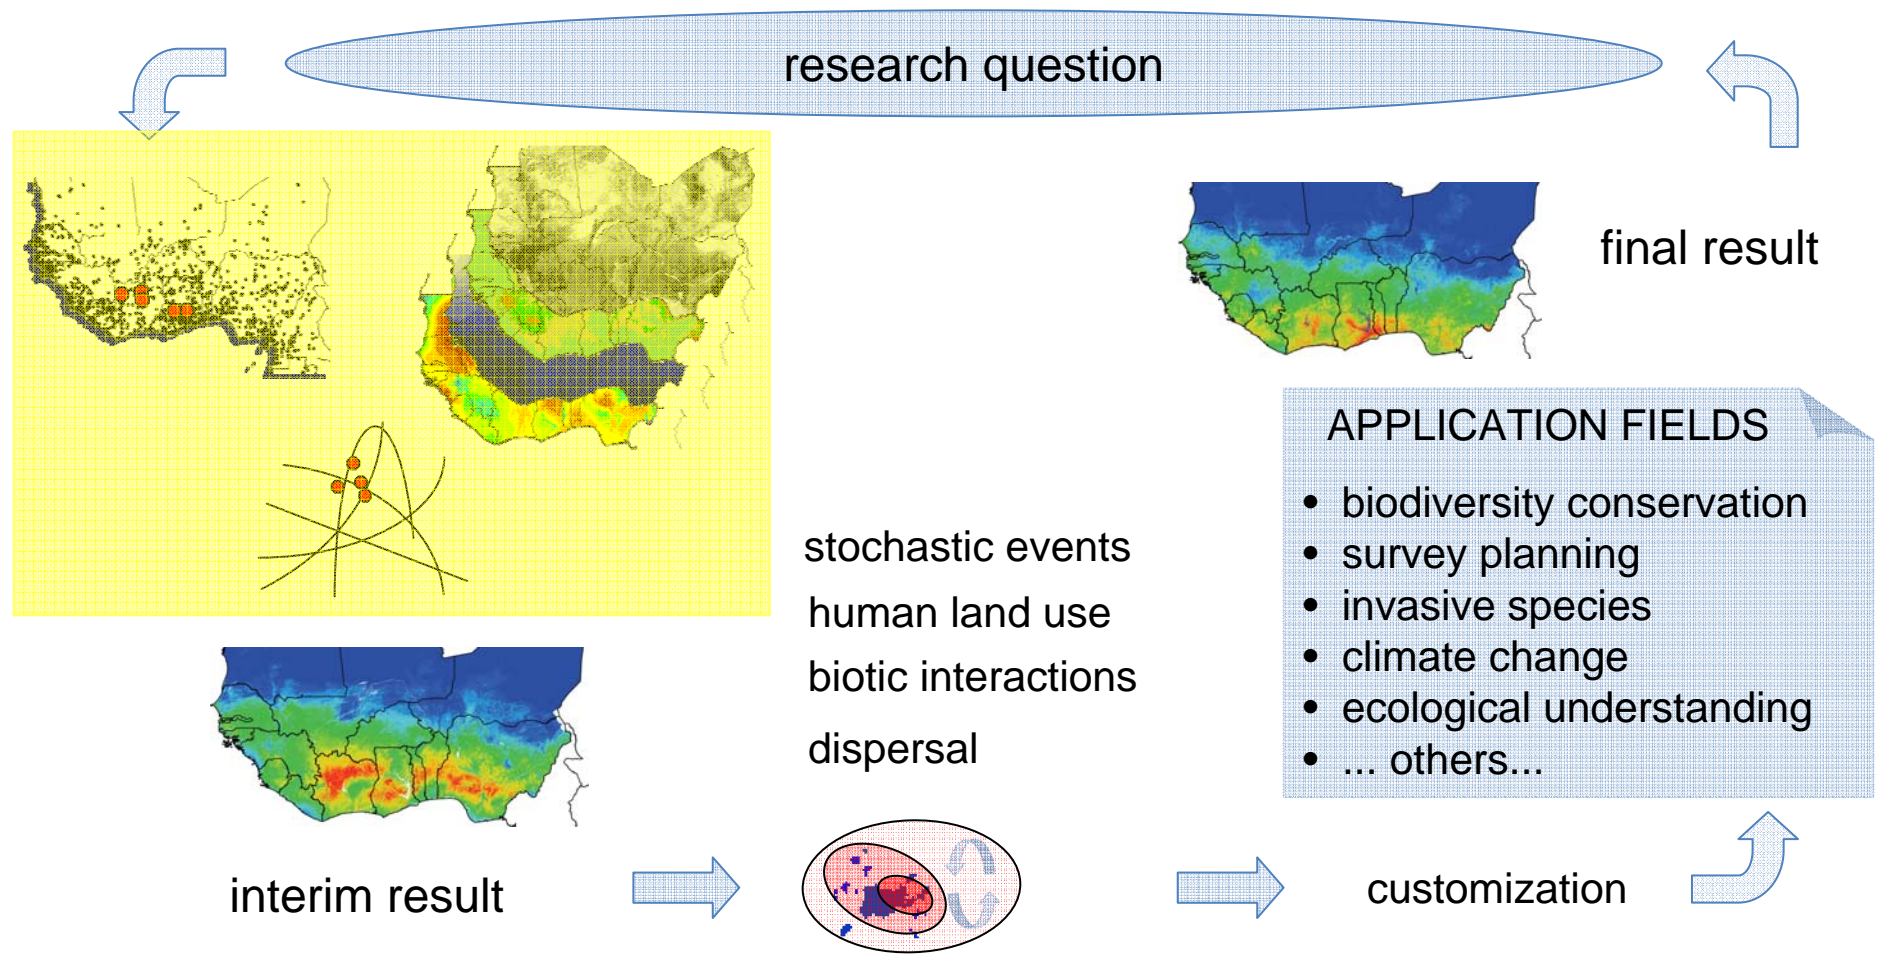

- Data assumptions
- Choosing model type
- Evaluating model quality
 - calibration / fit
 - discriminatory power
 - validation options

- Quantifying uncertainty

added value for decision-makers

[BIOTA West / García Marquez]

Selected challenges and solutions

An adequate framework

why bother?

FIGURE REMOVED

Species richness of bats; cell size $\sim 1 \text{ km}^2$

FIGURE REMOVED

Species richness of bats; cell size 0.5° ($\sim 3,000 \text{ km}^2$)

- Spatial extent
- Spatial resolution
- Temporal extent
- Temporal resolution

Expert knowledge required to capture a species' ecological niche at relevant scale

prevents decision-makers from using maps with false precision or over-prediction

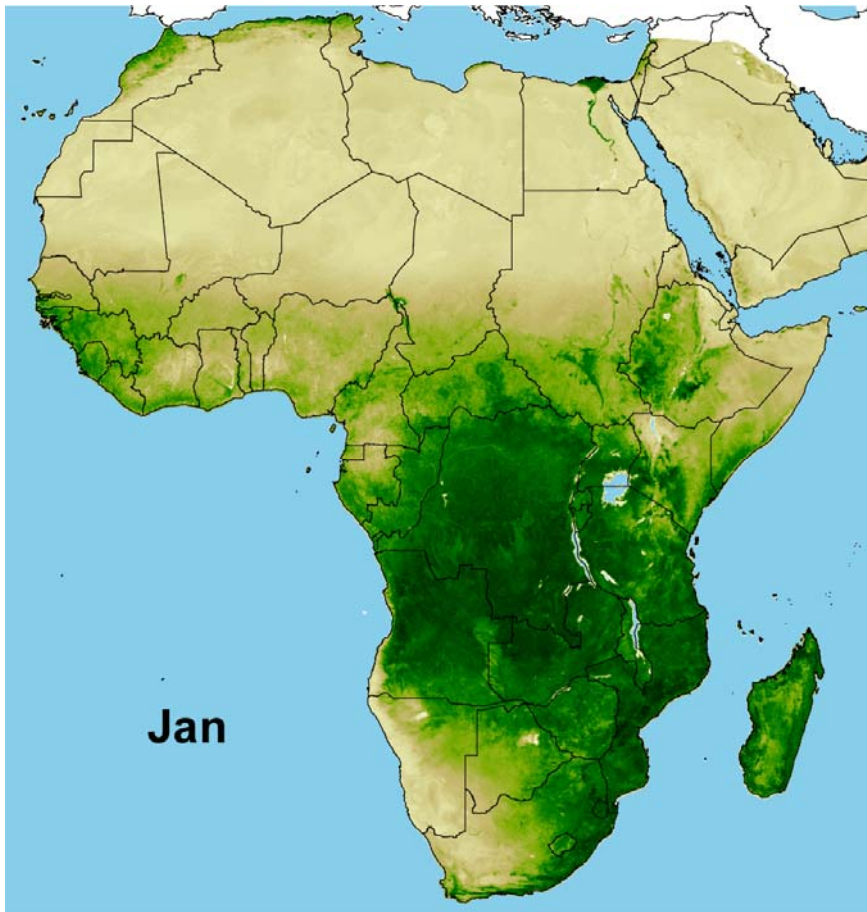

[BIOTA West / Fahr et al.]

Federal Ministry of Education and Research

An adequate framework

why bother?

- Spatial extent
- Spatial resolution
- Temporal extent
- Temporal resolution

Do mobile species respond to seasonal greening of vegetation?

(AVHRR NDVI, decadal, monthly averages 1981 – 2005)

[ADDS]

BIOLOG

Federal Ministry
of Education
and Research

An adequate framework

why bother?

- Spatial extent
- Spatial resolution
- Temporal extent
- Temporal resolution

FIGURE REMOVED

Monthly distribution models of *Eidolon helvum*;
Maxent; 8 environmental variables; n = 537

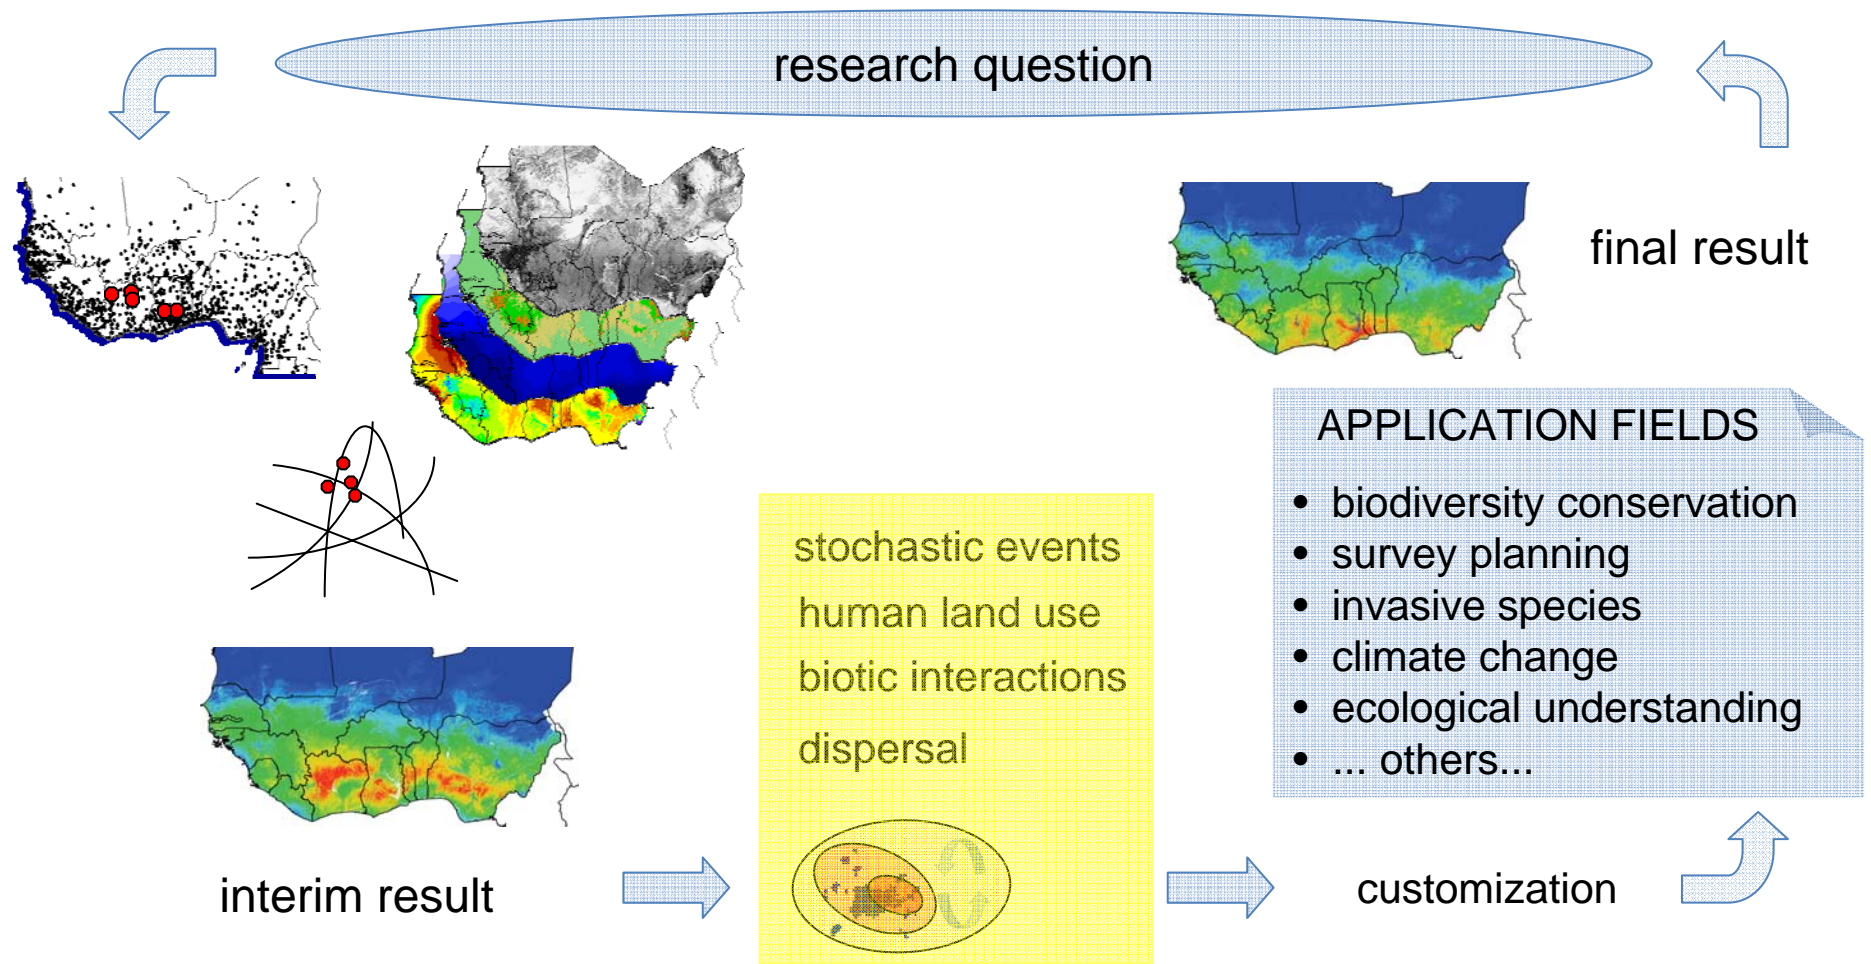

SDM provide evidence that some mobile species depend on seasonally shifting resources → important for decision-makers

[BIOTA West, Fahr et al.]

Federal Ministry
of Education
and Research

Selected challenges and solutions

Enhancing results

let's get real

Predicted habitat patches evaluated with an „omnidirectional connectivity“ index

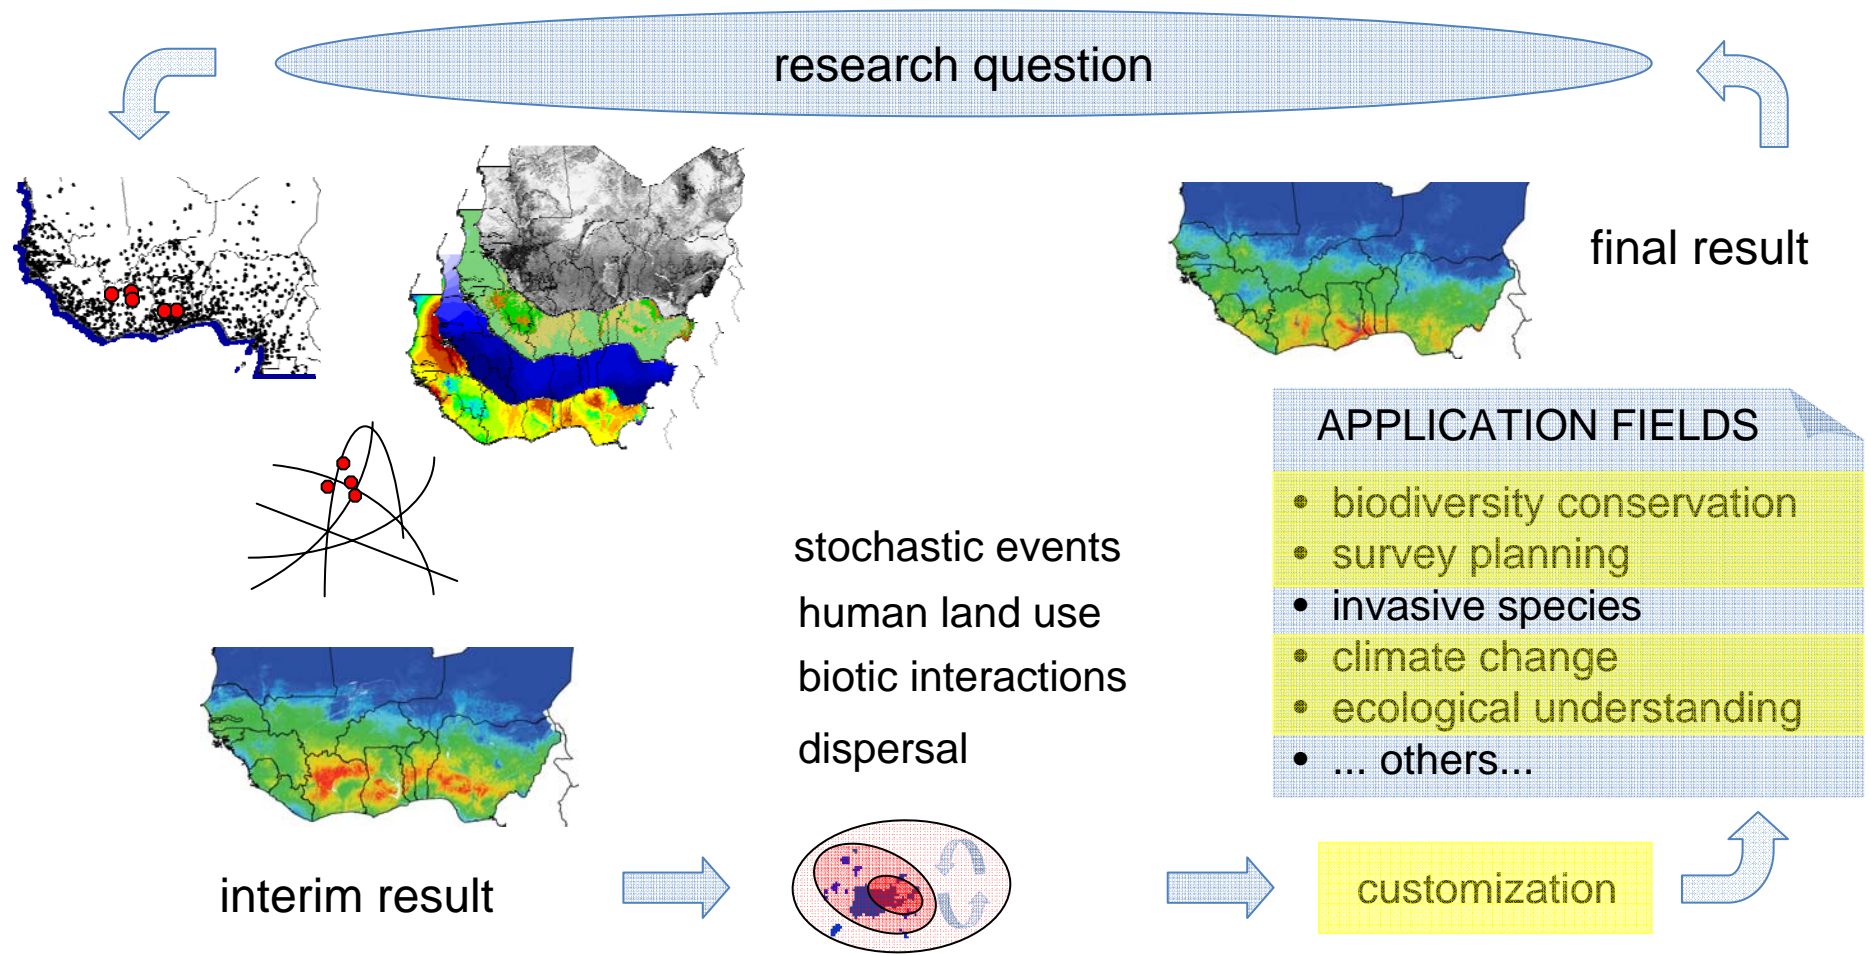

[BIOTA West, Wegmann]

- Dispersal
 - biogeography
 - metapopulation / habitat fragmentation
- Human land use
- Stochastic events
- Biotic interactions

ensures that predicted distribution maps exclude unsustainable patches

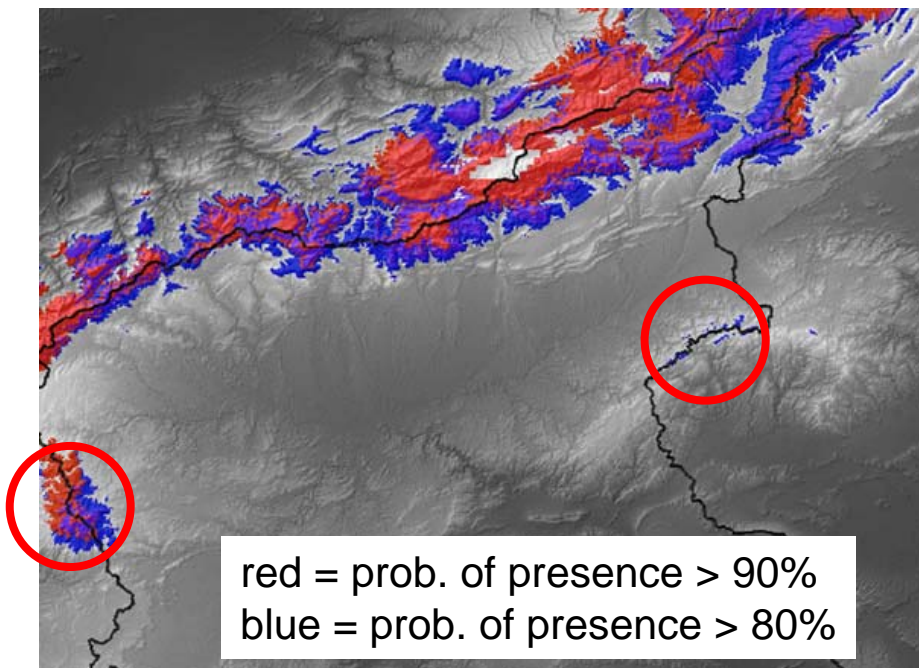

Selected challenges and solutions

The application field

menu du jour ou à la carte?

Change of predicted presence area of *Alyssum spinosum* if temperature + 2.5° C

- Ecological understanding
- Direction of future surveys
- **Climate change**
- Invasive species
- Biodiversity conservation

Climate change SDM should be based on abiotic variables only, as long as biotic interaction of target species are unknown - as done in this BIOTA project.

12 Climatic Variabels
ECHAM-REMO-LM-FOOT3DK
60 Geological / Soil Variabels
6 Topographical Variabels / DEM 30m

Variables actually used in tree construction:
ID367TMIN0 <= 6 °C
FROSTDAYS1 <= 140 days of frost
ID367TMAX0 <= 20.4 °C

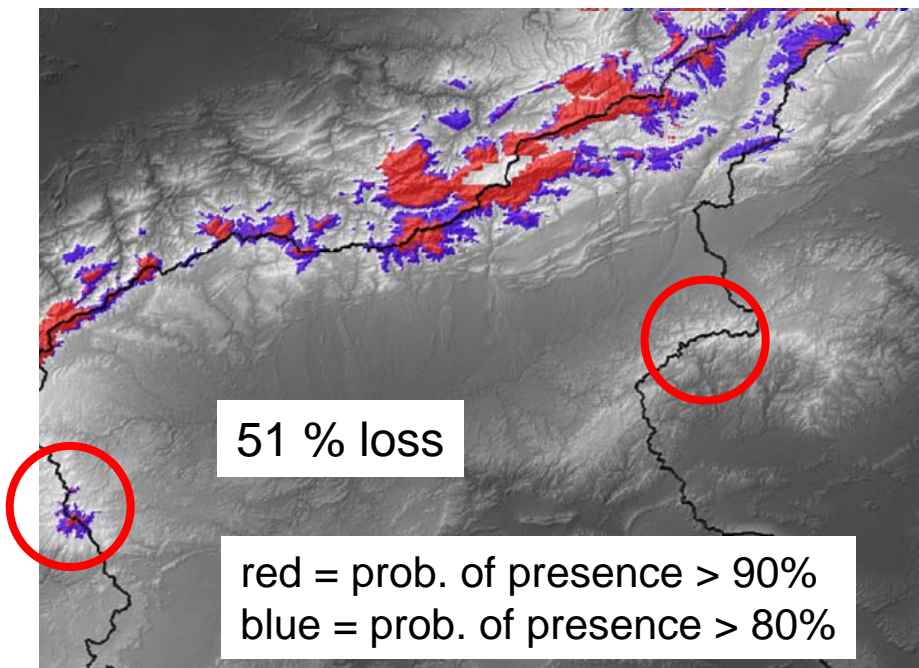

[BIOTA-Morocco]

- Direction of future surveys
- Climate change
- Invasive species
- Biodiversity conservation

Ordination analysis of SDM output (non-metric multidimensional scaling) for West African Red List Amphibians

SDM help understand drivers of species richness, ecosystem functions and services

[BIOTA West, Penner]

The application field

menu du jour ou à la carte?

Conversion of SDM output from continuous probability values to binary prediction map

- Ecological understanding
- Direction of future surveys
- Climate change
- Invasive species
- Biodiversity conservation

FIGURE REMOVED

Threshold setting must (and can) be done depending on application field

- Presence *Rhinolophus maclaudi*
- Core habitat (predicted)
- Peripheral habitat (predicted)

[BIOTA-West, Fahr et al.]

Conclusions & Implications

- SDM create important **new knowledge**
- SDM stand to **benefit from rapidly improving data**
- SDM can be exploited particularly well by researchers with biological **expert knowledge**
- Understanding of **model reliability** and data quality issues is critical
- Always consider intended **application** of SDM
- Decision-makers should (and can) be supplied with robust information on **uncertainties** of SDM

Federal Ministry
of Education
and Research

Outlook

- Need to improve integration of **biotic interactions** into SDM
- Improving „streaming“ data availability will enable SDM to support not only analysis but **also observation** tasks
- SDM would be a valuable contribution to any **early warning system** designed to detect threats to biodiversity (e.g. as in Scholes et al. 2008), especially if
 - a **dynamic link** was established between model predictions and remotely sensed land-cover change,
 - the user given the option to change the **scale** of analysis
 - if processing of interim results was done in response to the **management objective**
